Solana Earn

Getting Started

1 Get an API key

Create an account at platform.solana.com and generate an API key.

2 Transaction signing & submission

You call our API and it proposes a transaction to your custodian provider (Fireblocks, Privy, etc.). The API can optionally return an unsigned transaction, instead, for custom signing and submission schemes.

3 Deposit

Deposit into a strategy.

POST /v1/earn/vault-deposits {"strategyId":"<strategy-id>","custodyWalletId":"<wallet-id>","amount":"25"}

4 Check your balance

Read your Earn balance.

GET /v1/earn/vault-positions

Example response excerpt

{"data":{"positions":[
  {"label":"USDC vault","tokenValue":"25.12","withdrawableShares":"25"}
]}}

5 Withdraw

Request a withdrawal:

POST /v1/earn/vault-withdrawals {"positionId":"<position-id>","shares":"1"}

Asynchronous withdrawals

With a solver queue, you request now and receive funds when a solver fulfills it.

1 Submit the same terms with Idempotency-Key: <unique-key> (reuse on retries).

POST /v1/earn/vault-withdrawal-requests {"positionId":"<position-id>","shares":"1","discountBps":0,"deadlineSeconds":86400}

2 Poll the returned withdrawalRequestId until fulfilled; payout arrives automatically.

GET /v1/earn/vault-withdrawal-requests/<request-id>

The full details

Refer to our API Reference for complete details about requests and responses or point your agent at our llms.txt to complete your integration with Solana Earn.
